

Metis M311 / M322

Highly Advanced, Full Featured 2-Color Pyrometer Series

The Advantages and benefits for using a self-contained 2-color pyrometer:

- Automatic compensation for viewing through dirty windows, dust and partial smoke
- Compensates for changes in target emissivity
- Measures smaller target than sensor's field of view (FOV)
- Unaffected by moving targets within FOV

APPLICATIONS

- Induction heating
- Steel/metals
- Metal pour streams
- Kilns
- Vacuum furnaces
- Welding
- Ceramics
- **■** Composites
- Sintering
- Nuclear
- Research and development.

FEATURES

- Highest accuracy and repeatability even at high ambient temperatures up to 80°C (176°F) without cooling
- Temperature ranges between 300°C and 3300°C (572°F and 5972°F)
- Fully digital and very fast with response time <1 ms
- Adjustable or motorized focus optics
- Small spot sizes from 0.8 mm
- Laser, color video or thru-lens sighting
- Dirty window programmable alarm
- 10-digit matrix display for temperature and IR sensor parameters
- Push button device configuration or via software
- 2 high resolution 16 bit analog 0/4 to 20mA outputs
- 3 versatile configurable inputs or outputs
- Analog input for external emissivity setting
- Serial interfaces RS-232 and RS-485 (switchable)
- Optional fieldbus connection: Ethernet, Profinet, or Profibus

Technical Data

Ambient temperature	0 to 80°C (32 to 176°F), focusable lens assembly of fiber optic versions: -20 to 250°C (-4 to 482°F)										
Storage temperature	-20 to 85°C (-4 to 185°F)										
Relative humidity	No condensing conditions										
Housing / protection class	Aluminum, IP65 to DIN 40 050 with connector										
Weight	650 g (1 lb. 6.9 oz.)										
CE label	According to EU directives for electromagnetic immunity										

Reference Numbers

Metis M311 / Metis M322 Specify each with temperature range, sighting method and optics

Note: SensorTools software is included as standard equipment. Connection cables must be ordered separately.

Power Up and Measure Temperature

In principle the M3 series only requires connection to a power supply to start a measurement.

Metis M3 pyrometers are stand alone, self contained IR thermometers with direct outputs for easy integration in nearly all application environments.

The short-wave spectral ranges of the various models are specially designed for accurate temperature measurements of metals and other bright, reflective materials.

In comparison to radiation pyrometers, 2-color pyrometers measure in two spectral ranges simultaneously (at two wavelengths) and determine the temperature by forming the radiation ratio (quotient).

In this method it is not necessary to know the emissivity of the target material or fulfill the sensor's spot size with the target.

Features

Proven Sighting:

- More precise laser target marking
- Enhanced view finder
- New high dynamic color camera module

Clear Device Operation:

- Large, bright 10 digit display
- All measurement settings directly on the device
- LEDs for the display of active limit outputs
- Simple setting of the measuring distance with motor focus

Fast, Accurate Outputs:

- Serial high-speed interface up to 921 kBaud
- 2 high resolution 16 bit analog 0/4 to 20mA outputs

A Variety of Models:

- Motorized focus optics
- Optics with manual adjustment of focus
- Optical fiber version with small optical heads

Harsh Environmental Conditions:

Advanced ambient temperature up to 80°C

Focus

- Fiber optic models up to 250°C (optics and fiber optic cable)
- With Sapphire protection window (devices with integrated optics)

Sighting Method Selection

Sighting is used to pinpoint the location of the measured target.

- Devices with integrated optics: Through lens view finder, laser targeting light or color camera module
- Devices with fiber optics: Laser targeting light

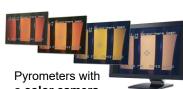

The view finder provides upright imagery so that the target under measurement can be viewed visually. A circular reticle shows the measuring spot. Recommended for glowing measurement objects, as a red laser is difficult to detect.

> For devices with measuring range above 1800°C, the eyepiece can be darkened for eye protection.

Laser targeting uses a red laser dot showing the center of the measuring field. At the focus point, the laser dot is the smallest and provides the sharpest image, so that the measuring distance for the smallest spot size can be easily determined.

Targeting light on / off

a color camera

module provide a composite video output that can be connected to a video monitor or PC with a converter. The pyrometer is aligned via a circular reticle on the TV screen and is recommended for remote observation of glowing hot targets or viewing down sight tubes. With the automatic, highly dynamic image brightness adjustment, the camera is also ideal for process monitoring.

Intelligent Installation Possibilities

Serial Interface RS-232 or RS-485 (selectable)

Via serial interface, the pyrometer communicates with other digital devices such as a PLC, computer with free *SensorTools* software or a self-written communication software program. Measured values can be recorded and device parameters can be set directly on the device, via *SensorTools* software or serial interface RS-232 or RS-485.

- RS-232 for short distances to the PC.
 Transfer rates of max. 115 kB
- RS-485 for long distance connection.
 Max. of 921 kB, use in bus configuration.

An interface converter RS-232 or RS-485 to USB (accessory) allows for easy connection to a PC.

- Over temperature, if the maximum allowed device temperature is exceeded
- · Signal strength is too low
- Each digital input can be connected to an external contact closure and configured for a function:
 - · Laser targeting light on and off
 - · Manually delete (reset) of maximum value storage
 - Start / stop recording of measured values via the SensorTools software
 - Up to 7 pyrometer configurations can be saved and retrieved
 - Start the control process on the device and the recording of the control process in the software
- Using the analog input a current can be fed for
 - · Analog specification of the emissivity slope or emissivity
 - · Devices with motorized focus: measuring distance

2 Analog Outputs

Each of the high-resolution analog outputs can be used for independent devices with 0/4-20 mA inputs,e.g. to connect additional temperature display.

The outputs allow measuring range limits between 0 and 6000°C/°F, even if the pyrometer does not have these ranges. This allows, for example, the limitation of the temperature range in order to increase the accuracy of the analog output even more or to expand the temperature range to replace the pyrometer in systems that work with other temperature measurement devices with different temperature ranges.

Optional Equipment

■ Fieldbus systems Profinet or Profibus

3 Configurable Inputs / Outputs

3 pyrometer connectors are available as digital input, digital output or analog input:

- Each digital output switches a low voltage output active or inactive (NC or NO, adjustable) with several selectable states (rear panel LEDs indicate the switching state):
 - Limit switch for decreasing or exceeding a certain temperature threshold
 - Material detection (exceeding the beginning of temperature range)
 - Device state (device is ready for operation)

PROCESS SENSORS METIS M3

Comprehensive Settings

Measuring Mode

2-color mode, switchable to 1-color modes (channel 1 or 2 selectable) for use as a standard radiation pyrometer.

Dirty Window Alarm

A signal strength monitoring function detects the degree of contamination of the pyrometer's optics, viewing window or identify interferences (dust...) in the IR sensor's sight path and triggers an alarm if activated.

Switch-off Level

The switch-off level defines a signal level, the temperature measurement is switched off, due to low level signal strength (e.g. if the contamination in the pyrometer field of view is too strong).

Peak Picker / Maximum Value Storage

The peak picker also detects the temperature when the measurement object appears only briefly in the pyrometer's field of view. Application example: rolling mills with scaled surfaces.

Material Properties

The input options for material entry have been simplified:

- Emissivity slope: Measuring objects whose emissivity is different at the two wavelengths (e.g. bright, unoxidized metal surfaces), the emissivity ratio can be adjusted. Targets with the same emissivity at the two wavelengths can be measured without adjustment of the slope/ratio setting.
- Emissivity: Each material has a max. emissivity of 1.00 which can be set, an adjustment up to 1.20 can be used. The emissivity adjustment above 1.00 allows for temperature corrections due to higher background reflection.
- **Transmittance:** For measurements through windows signal losses occur by transmission of the window. This value can be adjusted based on the window material.

Device Designs / Optics

Process Sensors 2-color pyrometers are equipped with two separate silicon or indium-gallium-arsenide detectors, which differ from sandwich detectors with very high signal strengths on both channels, ensuring high stability and accuracy.

Specially designed lenses compensate the color aberration at the two measurement wavelengths and ensure that the focal distances of the two wavelengths are collimating at the same position.

The pyrometer must be properly aligned to the measurement object to detect the temperature correctly. At the focal point of the lens (focal distance) the spot size diameter is smallest. Measurements made outside of the focus distance are also possible (in a shorter or longer distance than the focus distance) to determine the average temperature of a bigger spot.

Focusable optics (manual or motorized focus) can be continuously adjusted within the minimum and maximum specified measurement distance, providing the smallest possible spot size diameter at that focus distance.

Values in the optics tables illustrate the focused measuring distances and respective spot sizes. The spot size diameter for distances not given in the table can be interpolated.

The pyrometer can be used at distances other than its' focal distance, however the spot size is generally larger and therefore the target size must be larger.

This model refers to: Model M311, temperature range of 600-1400°C, laser targeting, RS232 & RS485 communication, manual focus optics, 1 ms response time, std. version sensor, onboard temperature display, two 0/4-20 mA outputs, 3 digital inputs/outputs, optics type A.

SensorTools Software

- Measured values of all channels: 2-color temperature + 1-color temperatures, at the same time, graphical and numerical
- Measured value recording
- Processing the results
- Displaying internal devices temperature
- Changing pyrometer parameters

Program functions:

- Change pyrometer parameters
- Playback of recorded data
- Adapted graphics mode to computer performance
- Export measured values in csv files
- Record interval setting for acceptable data size.
- Back time recording of measured values after control pulse
- Laser targeting light activation / camera display configuration
- External start and stop of the recording measured values (via control input on the pyrometer)
- Create a service file with settings for remote diagnostics
